

THE MONTCLAIR BIRD CLUB

YOUR WEEKLY BIRD 54

September 15, 2024

by Sandy Sorkin

Can you ID this bird?

Sometimes I shake the camera, other times the bird is uncooperative and moves, and sometimes the subject bird remains still while facing away from the camera. But whatever the reason for the problem picture may be, sometimes you can still identify the bird.

I enjoy the prospect of acquiring a sharp image of an interesting bird in the act of doing something exciting. The image below is sharp enough. The colors are accurate. But from what you see, it is a challenge to identify the bird.

The picture was taken south of Sierra Vista, Arizona, in August. Can you identify the bird? The answer is on the next page.

Bridled Titmouse

The United States range of the bridled titmouse is limited to the higher elevations in Arizona and New Mexico. In Mexico, it is found in the Sierra Madre Occidental at elevations from 3,500 to 10,000 feet.

If you would like to see your photographs highlighted here, send one or two pictures with a short paragraph to Sandy Sorkin & Rick Wright at MontclairBirdClub100@gmail.com.
